HRSJM NGO Website — Setup & Contribution Guide

Follow these steps carefully to set up the project locally and create your own Git branch.

1. Prerequisites

Make sure you have these installed:

- Git
- Node.js
- npm

Check your installation:

git --version

node --version

npm --version

If all three commands return a version number, you're ready.

---

2. Clone the Repository

Open your terminal / PowerShell / VS Code terminal and run:

git clone https://github.com/developer-gnt/HRSJM-NGO-WEBSITE.git

Then enter the project:

cd HRSJM-NGO-WEBSITE

---

3. Check the Repository

Run:

git status

You should see that you are currently on the default branch, most likely main.

You can also check:

git branch

---

4. Install Dependencies

Install all project dependencies:

npm install

Wait for the installation to finish completely.

If the project uses another package manager and the repository contains a corresponding lock file, use that package manager instead.

For example:

npm install

or, if applicable:

yarn

or:

pnpm install

---

5. Create Your Own Branch

⚠️ **Do NOT directly work on main.**

First make sure you have the latest code:

git checkout main

git pull origin main

Now create your own branch.

Replace YOUR-NAME with your actual name.

Example:

git checkout -b aman-shaikh

For another person:

git checkout -b john-doe

Recommended branch naming format:

firstname-lastname

Example:

aman-shaikh

---

6. Confirm Your Branch

Run:

git branch

You should see something like:

* aman-shaikh

  main

The * indicates your current branch.

You are now working on your own branch.

---

7. Start the Project

Run:

npm run dev

The terminal should show the local development URL.

Usually it will look something like:

http://localhost:5173

Open that URL in your browser.

Make sure the website loads correctly **before making any changes**.

---

8. Make Your Changes

Now work only inside your own branch.

For example:

aman-shaikh

Do NOT switch to main while making your changes.

After completing your work, check what changed:

git status

You can see the actual changes using:

git diff

---

9. Add Your Changes

Once you are satisfied with your changes:

git add .

Check again:

git status

Your modified files should now appear under changes to be committed.

---

10. Commit Your Changes

Create a clear commit message.

Example:

git commit -m "feat: update NGO website pages"

Other examples:

git commit -m "feat: add contact section"

git commit -m "fix: resolve responsive layout issues"

git commit -m "style: improve homepage UI"

Avoid messages like:

changes

update

done

test

Use a message that explains what you actually changed.

---

11. Push Your Branch to GitHub

Push your branch:

git push -u origin YOUR-BRANCH-NAME

For example:

git push -u origin aman-shaikh

After this, your branch will be available on GitHub.

---

12. Verify Your Branch

Go to the GitHub repository:

https://github.com/developer-gnt/HRSJM-NGO-WEBSITE

You should now be able to see your branch.

Your branch should look like:

main

aman-shaikh

Your work should be on:

aman-shaikh

NOT directly on:

main

---

13. Create a Pull Request

Once your work is complete:

1. Open the GitHub repository.
2. Go to **Pull requests**.
3. Click **New pull request**.
4. Select:

base: main

compare: YOUR-BRANCH-NAME

Example:

base: main

compare: aman-shaikh

5. Add a clear title.
6. Explain what you changed.
7. Create the Pull Request.

Do NOT merge your own PR unless you have been asked to do so.

⚡ Complete Command Flow

For someone who just wants the commands:

git clone https://github.com/developer-gnt/HRSJM-NGO-WEBSITE.git

cd HRSJM-NGO-WEBSITE

npm install

git checkout main

git pull origin main

git checkout -b YOUR-NAME

npm run dev

After making changes:

git status

git add .

git commit -m "feat: describe your changes"

git push -u origin YOUR-NAME

Then create a Pull Request on GitHub:

YOUR-NAME → main

⚠️ Important Rules

1. Never work directly on main

Always create your own branch first.

2. Use your own branch

Example:

aman-shaikh

3. Before starting new work

Always get the latest main:

git checkout main

git pull origin main

git checkout YOUR-NAME

4. Don't commit .env

If the project uses environment variables, do not push secrets, API keys, passwords, tokens, etc. to GitHub.

5. Before pushing

Always check:

git status

Make sure you aren't accidentally committing unnecessary files.

6. Keep commits meaningful

Prefer:

- feat: add donation section
- fix: fix mobile navbar
- style: improve hero section

instead of:

- update
- changes
- final
- final2
- ---
